

EASY INTEGRATION WITH VITANI DATAMANAGER

INTEGRATION MODULE TO NEDAP AEOS ENTERPRISE

FLEXIBLE INTEGRATION OF ACCESS CONTROL SYSTEMS

Vitani DataManager can be used as a link between different access control systems. This means that one can use Nedap AEOS as the overall management system and still continue to use one or several other current existing access control systems in a transition or as a permanent solution.

The Vitani DataManager module makes integration and synchronization between Nedap AEOS and other systems easy and flexible.

Existing access control systems can be maintained through a standardized integration while one simultaneously upgrades security in those parts of a business where the need for security is at the highest level. This flexibility makes it possible to provide a smooth replacement of our customers security system without changing the entire system at once. Does the need for access control on new doors arise, DataManager can easily be extended with network-based modules in Nedap AEOS and as a result of this the optimal security and administration is obtained at the same time.

For customers with current existing systems, Nedap AEOS can be used as the overall management system and a number of savings on card administration that generally were not possible can be achieved.

REDUCE ADMINISTRATION COSTS WITH DATAMANAGER

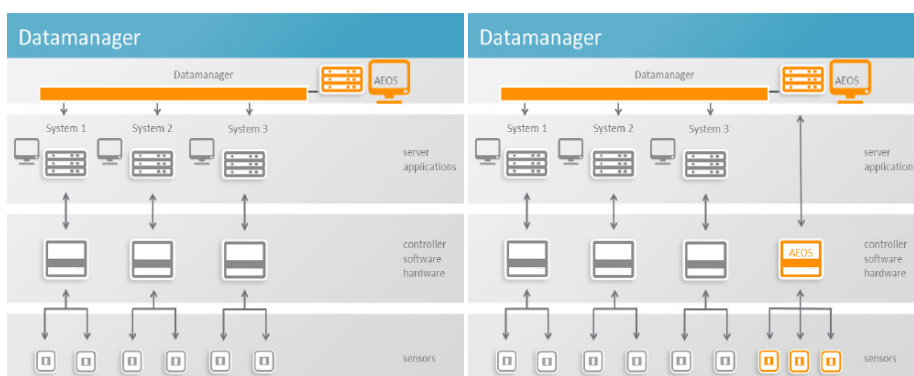

The Vitani DataManager aligns and futureproofs cardholder administration and at the same time it is lifetime prolonging existing systems and thereby it can reduce our customers costs of managing different systems. With many features and an integration to Nedap AEOS a web-based system where customers in a single solution can gather several authorisations, doors and schedules with access authorisations is created.

EXTEND THE FUNCTIONALITY WITH A WEBBASED ADMINISTRATION

The flexible design of Vitani DataManager makes it possible to integrate with Nedap AEOS through configuration files without changing anything in a business normal system. The DataManager solution provides that great independency between a current existing system and Nedap AEOS by making sure that an integration can be done without a customer is troubled with significant and normally very comprehensive development costs.

Together Nedap AEOS and Vitani DataManager makes it possible to extend the functionality of older systems. One user systems can be upgraded to multiple user systems and administration can be managed through a Danish web- and rolebased user interface which is standard in Nedap AEOS.

The possibilities are many and the costs are few. DataManager can be customised into specific needs for integration and assembling of multiple systems into one solution.

✓ WHAT ARE YOUR BENEFITS?

- Integration module to Nedap AEOS Enterprise.
- Amalgamation of several access control systems.
- Web-Based.
- Access Control in third part access control systems.
- Integration of personnel databases.
- Handling of cardholder rights.

✓ LANGUAGE

- DataManager is available in English and Danish.
- GUI can be local language.
- Translation by project request.

✓ GLOBAL ACCESS CARDS

- DataManager support use of multiple card technologies in local PACS.
- Integrated mapping of credential technologies and formats.
- Format translation and conversion.
- Integrated card interface to external ID card production.
